For Salesforce partners

A sealed go-live record for every Agentforce agent you ship

Since July 2026, new Agentforce agents are built in Agent Script, so each agent is now a single file that sets out what it can do. That makes it possible to check an agent before go-live and hand the client a record that anyone can verify.

How it works

- **You export the agent file** with the Salesforce CLI. It holds the agent's design, not customer data.
- **Fixed rules read it.** No AI in the decision, so the same file always gives the same result.
- **You get a sealed Agent Authority Record** listing every action, who decides when it runs, and what blocks go-live. It carries your branding for the client's board or risk team.
- **If the agent changes, the seal stops matching.** Each release gets a fresh record, which is billable work for you.

What it found in Salesforce's own sample agent

We ran it on the Local Info Agent from Salesforce's public Agentforce test-drive project, as published:

- It can offer to pass a guest to a person, but no route to a person is set. Salesforce's documentation says escalation needs a connection block naming that route.
- Both actions that call Apex or a Flow can be triggered by the LLM with no condition limiting when.
- The user the agent runs as is still a placeholder.

Salesforce's own compiler accepts the file. It checks that the script is valid, not whether the agent is ready to go live. That gap is what the record covers.

What you get as a partner

- A free record on one of your clients' agents, so you see the output before offering it.
- Records carrying your branding, with you setting the price to your client.
- A written commitment that we will not approach your clients directly.

Partner terms are shared on a short call.

Next step

Send one agent file to **john@akinmade.co.uk** and you'll get a sealed record back, free.
